About Me

Ever since I had written my first piece of code, I knew I was hooked. I am a passionate web developer who seeks challenges and wants to learn new skills everyday. It is instant gratification for me to see what I am able to create with code. It also makes me happy knowing that apps that I help create, are helping people in need, and providing them with a better life. Really, I don't think of coding as a job; it is more of a hobby for me, which I do everyday.

Skills

- JavaScript
- SQLite
- MongoDB
- HTML/CSS
- ReactJS
- Knex
- Microsoft Office Suite
- Django
- Python
- React Native

Experience

Seroful

This was a team project that I helped work on. Seroful is a web application that helps individuals in need of mental health help. The app provides the user with a daily journal to take notes in, a section to record medication and doses, and also includes a feature that allows users to video chat with a code that is shared between the two individuals. I was responsible for creating the profile and journal components as this project was created using the ReactJS Framework. Instead of using Redux for state management, my team decided to use MobX instead.

KwitterClone

This was a team project that I helped work on. My team was given a starter template to work off of, and we were to add features to make the Twitter clone a usable web application. The web application was created using the ReactJS Framework and Redux for state management. I was responsible for setting up the Redux store and other various components. I enjoyed working on this project very much.

Tower of Hanoi

This was a team project that I helped work on. This project is based off of the Tower of Hanoi game, but a simplified version of it. The web application was coded in Vanilla Javascript, and I worked with one other team member to get this project completed. This was one of the very first projects that I had worked on with another team member while attending Kenzie Academy.
